

CyberShield Edge AI Privacy- Preserving On- Device Cybersecurity Assistant

Designed for Snapdragon-powered HP PCs

SNAPDRAGON® AI LAB BUILD & PRESENT CHALLENGE

Presented by Charumathi S

Why Cybersecurity Needs Edge AI

Log Overload

Security systems generate massive volumes of logs — manual analysis is slow and error-prone.

Privacy Risk

Cloud-based analysis can expose sensitive security data, creating compliance and trust concerns.

Connectivity Gaps

Offline or low-bandwidth environments leave devices unprotected when cloud dependency is high.

Speed Matters

Fast threat detection is critical — every second of delay increases potential damage.

- ❏ **Core question:** How can we analyze cyber threats quickly while keeping sensitive data on the device?

Introducing CyberShield Edge AI

CyberShield Edge AI is an AI-powered cybersecurity assistant that brings intelligent threat analysis directly to the user's device — no cloud required.

- Analyze security logs locally
- Detect suspicious activities
- Identify attack patterns
- Map possible attack chains
- Suggest response actions

How It Works

From raw security logs to actionable response — all processed on-device.

i Sensitive security analysis is designed for local/on-device processing — no data leaves the device.

Why Edge AI on Snapdragon?

Faster Local Analysis

On-device inference eliminates cloud round-trip latency.

Privacy-First

Sensitive security data never leaves the device.

Reduced Cloud Dependency

Operational in offline or restricted environments.

Offline-Friendly

Designed for local workflows without internet reliance.

Efficient AI Inference

Optimized for resource-constrained edge devices.

Designed and intended to be optimized for **Snapdragon-powered HP PCs**.

Key Features

Threat Detection

Identifies suspicious activities from security logs in real time.

Attack Chain Analysis

Connects related events to reveal the full scope of a potential attack.

AI-Based Analysis

Uses on-device AI to interpret and understand complex security events.

Privacy-Focused

Keeps sensitive security information strictly on the device.

Edge Processing

Designed for efficient on-device AI workloads with minimal overhead.

Demo: From Suspicious Event to Response

Demo Flow

01

Input security logs

02

AI analyzes events

03

Suspicious activity detected

04

Related events connected

05

Attack chain displayed

06

Response suggestion generated

  Demo screenshots of CyberShield Edge AI in action would appear here.

Impact & Future Roadmap

Today's Impact

- Privacy-aware cybersecurity for everyday users
- Faster local threat analysis
- Reduced cloud dependency
- Intelligent security assistance at the edge

What's Next

- Qualcomm AI Hub model integration
- Expanded threat categories & log formats
- Deeper Snapdragon optimization
- Real-time threat monitoring

"CyberShield Edge AI brings intelligent cybersecurity closer to where the data lives — the device."
