

Brief Project Description

CyberShield Edge AI is an AI-powered cybersecurity assistant designed to run on Snapdragon-powered HP PCs. It analyzes system and security logs directly on the device to identify suspicious activities and possible cyber threats. The system detects unusual patterns, understands attack chains, and provides suitable response suggestions.

Unlike cloud-based security tools, CyberShield Edge AI focuses on local processing, which helps reduce cloud dependency and keeps sensitive security information on the user's device. The solution is designed to use lightweight AI models for faster and efficient on-device analysis.

CyberShield Edge AI can help users understand security alerts and respond to threats more quickly. The project demonstrates how **Edge AI and cybersecurity** can work together to provide a **private, fast, and intelligent security solution**. In the future, the system can be further optimized using AI models available through **Qualcomm AI Hub** for improved performance on Snapdragon platforms.
